Imscribing Grammar Periodic Table

Janet (left-step) arrangement · primary axes: $\Omega\times$ (block) and Γ (period)

s-block (Ω_0, $\perp_0$) p-block ($\Omega_{\mathbb{Z}_2}$, $\perp_1$) d-block ($\Omega_{\mathbb{Z}}$, $\perp_1$) f-block ($\Omega_{\mathbb{Z}}$, $\perp_{\geq 2}$) darker shade = higher Γ (p

Cell annotation (bottom): dominant IG primitive — $\perp$=Chirality · $\odot$=Criticality · $\ni$=Coupling · Σ=Stoichiometry · $\dashv$=Topology · <=Parity · $\top$=Kinetics · $\vdash$=Dimensionality. Dashed border = radioactive.

Top-right dot (FDE / Belnap FOUR): ● **T**=PGM catalysts (always Frobenius) ● **B**=context-dependent ($\mu \circ \delta = \mathrm{id}$ sometimes) ○ **N**=indeterminate ● **F**=noble gas (no δ).

— organic thread (H C N O S P) — metallic thread (Fe Ni Zn Mo Rh Pd W Ir Pt Au) - - enzyme bridge (σ_1 crossing).

Frobenius threading braid $\mu \circ \delta = \mathrm{id}$
