

Imscribing Grammar Periodic Table

Janet (left-step) arrangement · primary axes: $\Omega \times \mathbb{H}$ (block) and Γ (period)

s-block ($\Omega_0, \mathbb{H}_0$) p-block ($\Omega_{\mathbb{Z}_2}, \mathbb{H}_1$) d-block ($\Omega_{\mathbb{Z}}, \mathbb{H}_1$) f-block ($\Omega_{\mathbb{Z}}, \mathbb{H}_{\geq 2}$) darker shade = higher Γ (p)

Cell annotation (bottom): dominant IG primitive — $\mathbb{H}$ =Chirality · $\odot$ =Criticality · $\circ$ =Coupling · Σ =Stoichiometry · $\flat$ =Topology · Φ =Parity · ζ =Kinetics · Θ =Dimensionality. Dashed border = radioactive.

Top-right dot (FDE / Belnap FOUR): ● **T**=PGM catalysts (always Frobenius) ● **B**=context-dependent ($\mu \circ \delta = \text{id}$ sometimes) ○ **N**=indeterminate ● **F**=noble gas (no δ).

— organic thread (H C N O S P) — metallic thread (Fe Ni Zn Mo Rh Pd W Ir Pt Au) - - enzyme bridge (σ_1 crossing).

Frobenius threading braid $\mu \circ \delta = \text{id}$
