

Solve — Crafting the *Lapis Philosophorum*

the *Automatica Principia Proceduralis*

∞

The 12 primitives of the Inscribing Grammar — the 12 facets of the Philosopher’s Stone — are derived from a bare abstract category $\mathcal{C}$ via the four classical alchemical operations — *Nigredo*, *Albedo*, *Citrinitas*, & *Rubedo*.

0 – *Prima Materia*.

Performing the operations on ordinary, inert matter was an understandable, categorical error of history’s alchemists. However some, like Luria, knew *precisely* the material upon which the *Work* is meant to be done.

Take: abstract category $\mathcal{C}$.

No primitives yet — the starting object has no invariants beyond the axioms of a category itself. This was always the intended *prima materia*: the undifferentiated substance from which begins the *Work*.

I – *Nigredo* — Logical on $\mathcal{C}$.

- L1 (adjunction) $\rightarrow R$ (relational mode: adjoint structure)
- L2 (dagger) $\rightarrow R$ (confirms and refines R value)

R is the first primitive to crystallize: it is a logical property of the morphisms of $\mathcal{C}$ directly. This is the *nigredo*: the blackening, decomposing the undifferentiated into distinct relational modes.

II – *Albedo* — Inductive on $\mathcal{C}$.

- I2 (iteration) $\rightarrow H$ (temporal depth: depth of stabilization)
- I3 (classifying) $\rightarrow \Omega$ (winding: π_1 of BC)
- I4 (Yoneda) $\rightarrow D$ (dimensionality: $D_\odot$ if Yoneda is point-surjective; free cocompletion size gives D_∞ , D_Δ , $D_\wedge$)

This is the *albedo*: the whitening, purifying the base substance and reconstituting it at higher resolution.

III – *Citrinitas* — Algebraic on $\mathcal{C}$.

- A1 (monoidal) $\rightarrow S$ (stoichiometry: arity of generators); P (parity: symmetry of tensor)
- A2 (monad) $\rightarrow K$ (kinetics: spectral properties of μ)
- A3 (dagger) $\rightarrow F$ (fidelity: unitality of duals)
- A4 (enriched) $\rightarrow \Gamma$ (interaction grammar: enrichment base)

After Stage 3, $\mathcal{C}$ is a symmetric monoidal dagger category with a monad and enrichment. All shape primitives are determined, but the gate primitives (T , Φ) require one more step. This is the *citrinitas*: the yellowing, transmuting intermediate forms into structured algebraic layers.

IV – *Rubedo* — Logical on algebraically-enriched $\mathcal{C}$.

- L3 (cartesian closure) $\rightarrow T$ (topology: does the state space admit internal homs?)
- L6 (paraconsistent negation) $\rightarrow$ determines the truth-value structure in which L4 will be evaluated
- L4 (Lawvere) under L6 $\rightarrow \Phi$:
 - Classical (L4 holds, no L6): Φ_c
 - Dialetheic (LP truth value **b**): Φ_c^C
 - Inclosure (contradicts via Inclosure Schema, L6 blocks explosion): Φ_{EP}
 - L4 fails: Φ_{sub} or Φ_{super}
- L5 (Frobenius) $\rightarrow P$ promotes to $P_\pm^{\text{sym}}$ if $\mu \circ \delta = \text{id}$

Cross-stage: G (*Albedo* $\times$ *Citrinitas*). G (scope) is the correlation length of the Yoneda embedding under the monoidal structure. Local ($G_\sqsupset$) if the tensor decouples; global ($G_\aleph$) if faithfulness holds across all scales. This is the *rubedo*: the reddening, the final perfection where the gate primitives lock.

“Solvatum et Praecipitatum” — the gate primitives lock.

The Stone is complete.
